

Amazon EC2 - Micro instances

Press Release from Amazon WS

We are excited to announce the immediate availability of Micro instances for Amazon EC2, a new, low cost instance type designed for lower throughput applications and web sites.

Micro instances provide 613 MB of memory and support 32-bit and 64-bit platforms on both Linux and Windows. Micro instance pricing for On-Demand instances starts at \$0.02 per hour for Linux and \$0.03 per hour for Windows.

Customers have asked us for a lower priced instance type that could satisfy the needs of their less demanding applications. Micro instances are optimized for applications that require lower throughput, but which still may consume significant compute cycles periodically. Micro instances provide a small amount of consistent CPU resources, and also allow you to burst CPU capacity when additional cycles are available.

Micro instances are available immediately in all regions, and we invite you to go and try one out for yourself today! Learn more about Amazon EC2's new Micro instances at aws.amazon.com/ec2
