

SNS added to AWS Console

Press Release from Amazon WS

We're excited to announce that we've added support for [Amazon Simple Notification Service](#) (SNS) to the AWS Management Console. Amazon SNS makes it easy to manage and send notifications from the cloud. This service offers push notifications and pub-sub messaging which can be used to support distributed applications or move time-sensitive data to and from Amazon EC2 instances. The AWS Management Console adds the simplicity of a point-and-click web interface. You can now create topics, add subscribers, send notifications, and edit topic policies - all from your browser. In addition, the AWS Management Console can also be used to add or manage subscribers and publish messages over your protocol of choice (HTTP, email, SQS protocol, etc.).

The AWS Management Console is available free of charge at: aws.amazon.com/console .

Sincerely,

The Amazon SNS Team
